

Azure Blob Storage

Microsoft Azure Blob Storage

Description

Setup Instructions

Prereqs

- An Azure subscription and permission to create resources.
- Decide the subscription, resource group, and region you'll use.

A. Create a Storage Account (portal)

1. In the Azure portal, select Create a resource → Storage account.
2. Basics tab
 - Subscription / Resource group: choose or create.
 - Storage account name: globally unique, lower-case letters & numbers.
 - Region: pick a region close to your users or data pipelines.
 - Performance: Standard (HDD-backed; cost-effective) is typical; Premium adds low-latency options. [\[OBJ\]](#)
3. Redundancy: choose LRS (cheapest, single region) or higher (ZRS/GZRS) for more durability/availability. [\[OBJ\]](#)
4. Leave other defaults unless you have specific needs → Review + create → Create. [\[OBJ\]](#)

B. Create a Blob Container

1. Open your new storage account → Data storage → Containers → + Container.
2. Name: e.g., raw-csv.

3. Public access level: keep Private (no anonymous access) for most data workloads.

4. Create. 

Why a container? All blob data lives inside containers—nothing can be uploaded until one exists.

C. Upload CSV files via the portal

1. Open your container → Upload.
2. Drag-and-drop your .csv files or select Browse for files.
3. (Optional) Set the blob type (default Block blob is correct) and blob tier (Hot/Cool/Archive).
4. Click Upload to finish. 

(Optional) Where to find your connection strings/keys

If you'll programmatically access blobs later, fetch a connection string under Security + networking → Access keys in the storage account. Keep it secret; prefer managed identities or SAS when possible.
